From Frank B. (ASU)
BTW, I found these "Soldering Hands" very useful as a specimen tray. You can get some tiny neodymium magnets to securely place your specimens the magnetic base. And the flexible "hands" are useful, if you want to more easily position a specimen so it is +/- level to the camera sensor (less challenges with depth of field).

And using self-adhesive magnetic sheets the x-rite color target and this scale bar template you can make yourself a color target and scale bar that easily adhere to the magnetic base.
